Team Luminous – Phase I AI Usage Report

Course: CptS 484 – Software Requirements

Project: Akita (THEIA)

Team Members: Runlin Zhao, Nathaniel Gaines, Keagen Chapman

1. Runlin Zhao

I used Claude to organize my thoughts, clarify project requirements, and assist with planning and assigning tasks during team meetings. I also used Gemini to refine the wording of written materials, improve document formatting, and organize the team peer review form. AI was used as a supporting tool for planning, editing, and organization rather than as a replacement for my own analysis and decision-making. I remained responsible for reviewing and finalizing my own work.

2. Nathaniel Gaines

I wrote the requirements, specifications, and traceability tables myself based on Runlin's Section 2 and the course materials. I then used Claude to refine the wording, check the consistency of requirement IDs across Sections 2, 3, and 7, and format the tables.

I also used Claude to help revise the project plan based on Professor Zeng's feedback, prepare the peer review form, and edit the presentation video by trimming unnecessary pauses while preserving the team's original slides and audio.

I reviewed all materials before including them in the project deliverables.

3. Keagen Chapman

AI was used to help create a concise prototype description based on the team's existing project documents and to generate sample visualizations illustrating interactions between users and the Akita system.

4. Summary

During Phase I, the team used AI tools to support planning, writing refinement, document formatting, consistency checking, prototype visualization, and presentation preparation.

The descriptions above reflect each team member's reported AI usage. AI-assisted contributions are disclosed separately to maintain transparency about how the tools were used during the project.
